

SCREENS

FOR SOCIAL DISTANCING

PAD unframed, glazed extension screens (660mm high from desk), over PAD screens (340mm high), and ScreenGuard freestanding, unframed, clear acrylic screens (660mm high). On Ligni bench.

SCREENS

FOR SOCIAL DISTANCING

Examples with specifications

Using screens to create protective barriers within offices, without creating oppressive “fortresses”.

Here we illustrate both additions to existing screen layouts and examples of new layouts based around social distancing requirements.

There is no definitive answer to the question “What height should barrier screens be?” The main function of barrier screens is to protect against coughed or sneezed airborne droplets, which are relatively large and fall from the air, due to gravity, within a short distance.

No screening can fully protect against viral aerosols —fine particles that can float in the air for hours — but the weight of evidence seems to suggest that aerosol transmission is negligible, if it occurs at all, outside of healthcare settings where there is very close contact between infected people and healthcare workers.

We suggest that 660mm above desk height provides an appropriate barrier against airborne droplets between seated people, and floor standing screens 1895mm high an appropriate barrier between standing people (or a standing person and a seated person).
